

Ancillary Products

To compliment our full range of adaptations, we offer some key ancillary products that will help improve your driving experience.

Boot Strap

Designed to assist with closing the tailgate, where it is too high to reach.

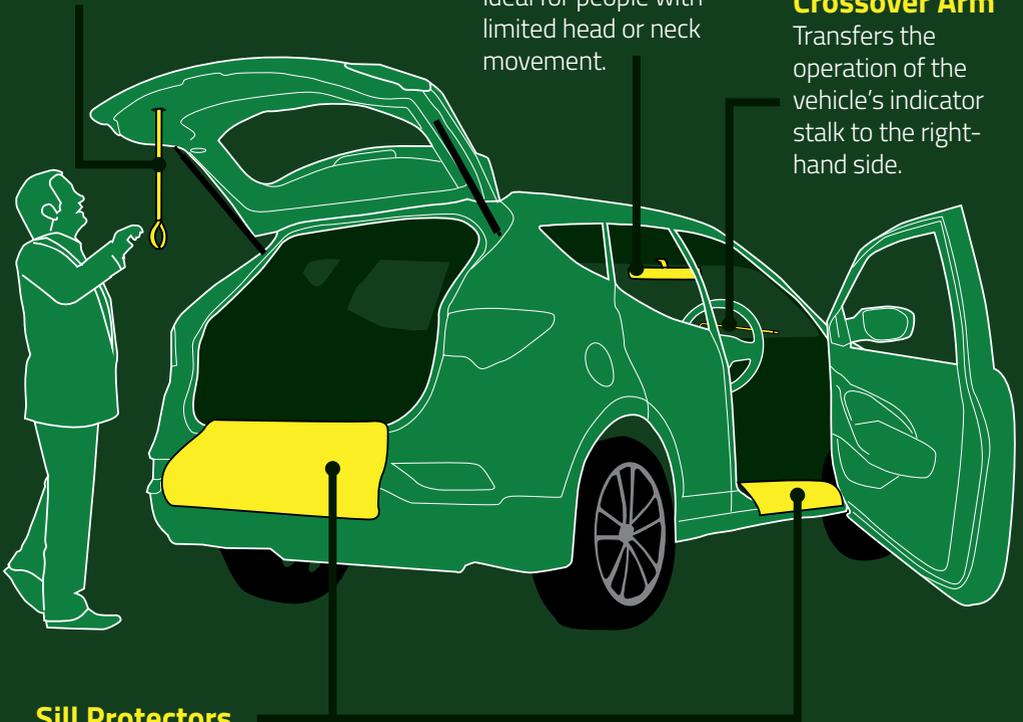

Panoramic Mirror

Ideal for people with limited head or neck movement.

Stalk

Crossover Arm

Transfers the operation of the vehicle's indicator stalk to the right-hand side.

Sill Protectors

An ideal way to protect your vehicle sills without having to modify your vehicle.

Boot Strap

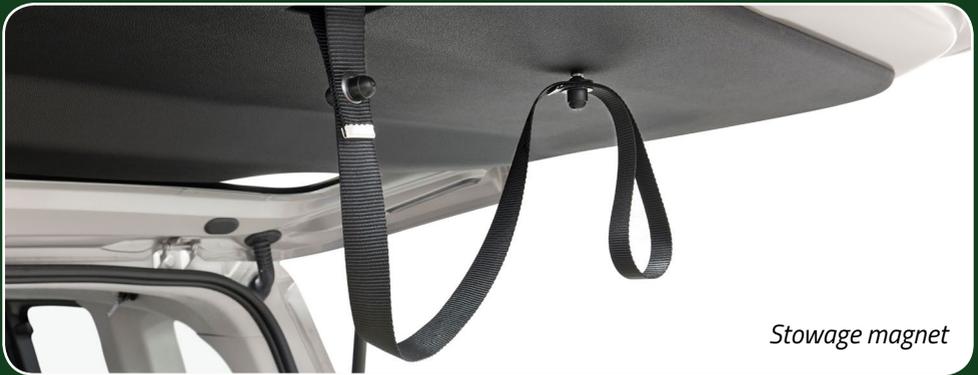

The boot strap assists with closing the tailgate, where it is too high to reach.

Operation

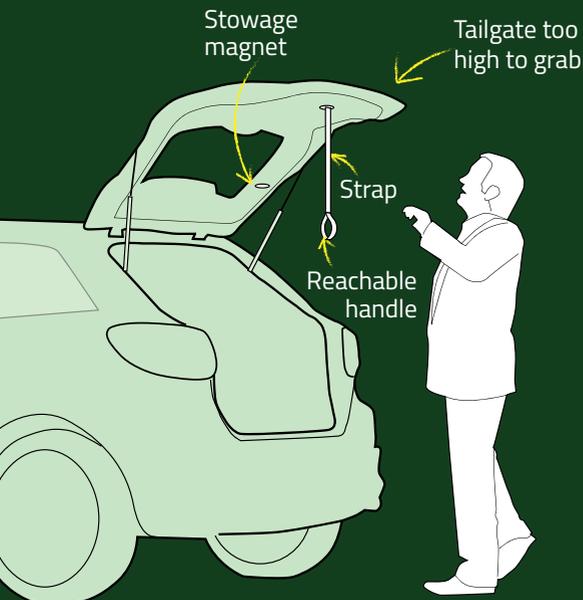

The strap is fixed at a convenient point on the inside of the tailgate. It is used to pull down the tailgate to a height where it can be reached and then it stores away neatly using a magnet before closing.

Boot strap

Stowage magnet

Operation

-  1. Pull strap until tailgate can be reached.
-  2. Hold tailgate with one hand whilst attaching strap to magnet.
-  3. Close boot by pushing tailgate.
The force of the boot closing will release the strap from the magnet so it can be reached when boot is next opened.

Sill Protector

The sill protector is an ideal way to protect your vehicle sill quickly and easily without having to modify your vehicle or cover it with adhesive, which is difficult to remove.

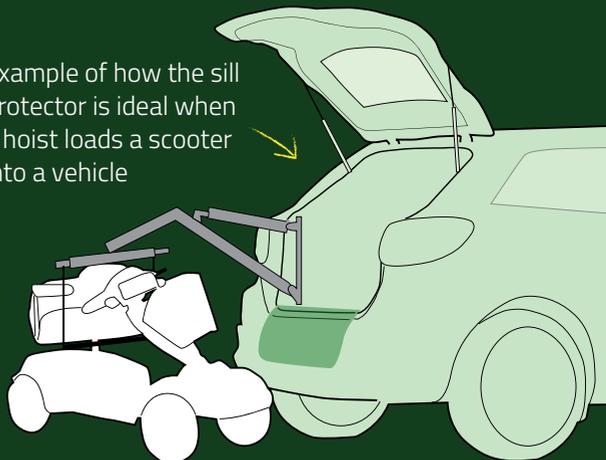

Sill Protector

Operation

It can be used to protect the door sills when transferring into the vehicle from a wheelchair or to protect the bumper when loading in and out of the boot.

The sill protector can either be tucked into the vehicle trim along one edge and then folded out when it is required, or it can be kept loose and simply placed over the sill when in use. Keeping it loose allows for it to be used on multiple sills depending on where you are entering the vehicle or loading your wheelchair.

Example of how the sill protector is ideal when a hoist loads a scooter into a vehicle

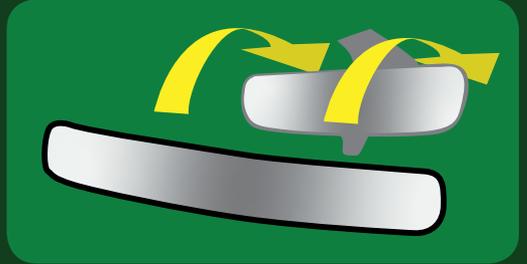

Panoramic Mirror

The panoramic mirror gives the driver a complete panoramic view of the rear of the vehicle.

Operation

The mirror simply clips over the existing rear-view mirror in the vehicle.

Stalk Crossover Arm

Designed to transfer the operation of the vehicle's indicator stalk from the left-hand side to the right-hand side.

Operation

An extension bar is fixed to the existing indicator stalk and then runs behind the steering wheel to the right-hand side. The indicator stalk can be operated using the right hand on the extended bar.

Further Information To discuss the adaptations in further detail, please do not hesitate to contact us using the below details.
